CAMPUSHIRE

PLACEMENT MANAGEMENT SYSTEM

A Web-Based Placement Management Application

Academic Project Report

2026

ABSTRACT

The **CampusHire – Placement Management System** is a web-based application designed to simplify and organize the placement activities of a college. It provides a centralized interface for managing student records, recruiting companies, job postings and student applications.

The application is developed using **HTML, CSS and JavaScript**. A dashboard displays placement statistics such as total students, partner companies, open job postings and students placed. Separate modules are provided for students, companies, job postings and applications.

The system supports record management, search, filtering, sorting, application tracking, notifications and dashboard statistics. The current version uses an **in-memory data store**, so data resets when the webpage is reloaded. The project provides a lightweight prototype that can later be extended with a backend database and authentication.

1. INTRODUCTION

The CampusHire – Placement Management System is a simple web application created to organize college placement activities. Placement departments need to maintain information about students, recruiting companies, job opportunities, application status and placement outcomes.

Managing these records manually through registers or separate spreadsheets can make searching, updating and tracking information difficult. CampusHire provides a single interface where placement-related information can be viewed and managed.

The application uses a dashboard and dedicated pages for students, companies, job postings and applications. It is designed as a lightweight client-side application that can run directly in a modern web browser.

2. PROBLEM STATEMENT

Placement information may be maintained through multiple documents or manual records. This can create difficulty in maintaining updated records and monitoring application progress.

- Major problems include:
- Manual maintenance of student and company records.
- Time-consuming searching and updating of information.
- Difficulty in tracking student applications.
- Limited centralized visibility of placement activity.
- Manual calculation of placement statistics.

3. EXISTING SYSTEM

In a conventional placement process, student information, company details, job opportunities and application records may be maintained using paper registers, spreadsheets or separate documents.

This approach can work for small amounts of information, but becomes less convenient as the number of students and companies increases. Searching and updating records may require repeated manual work.

4. PROPOSED SYSTEM

The proposed CampusHire system provides a centralized web interface for managing placement activities. It contains five major areas: Dashboard, Students, Companies, Job Postings and Applications.

The dashboard summarizes placement activity, while the management pages allow records to be added, searched, filtered and tracked. The current version does not require Python, Node.js or a separate database server.

5. OBJECTIVES

- To develop a simple placement management application.
- To maintain student placement records.
- To maintain recruiting company information.
- To manage job opportunities and eligibility criteria.
- To track student applications through different stages.
- To display placement statistics on a dashboard.
- To provide search, filtering and sorting facilities.

- To reduce manual placement management work.

6. SCOPE OF THE PROJECT

Student Management: Student ID, name, department, CGPA, email, phone number and placement status can be maintained.

Company Management: Company ID, name, industry, contact email and website can be maintained.

Job Management: Job role, company, package, minimum CGPA, deadline and status can be maintained.

Application Management: Applications can be tracked using Applied, Shortlisted, Placed and Rejected statuses.

7. SYSTEM REQUIREMENTS

Hardware: Computer/laptop, minimum 4 GB RAM, keyboard and mouse, and basic storage space.

Software: Windows/Linux/macOS, a modern web browser and Visual Studio Code.

Development Technologies: HTML5, CSS3 and JavaScript.

Runtime: The current version can be opened directly in a modern browser; no separate backend runtime is required.

8. TECHNOLOGIES USED

HTML5: Creates the structure of navigation, dashboard, tables, forms and modal windows.

CSS3: Provides layout, colors, cards, buttons, tables, responsive behavior, status indicators and animations.

JavaScript: Provides navigation, rendering, searching, filtering, sorting, record management, application submission, statistics and notifications.

9. SYSTEM ARCHITECTURE

The current application follows a simple client-side architecture. The user interacts with the web browser, which loads the HTML interface. CSS provides presentation and JavaScript controls application logic and temporary data.

Architecture Flow: User → Web Browser → HTML Interface → CSS Presentation → JavaScript Logic → In-Memory Data Store

The application does not currently communicate with an external server or permanent database.

10. SYSTEM MODULES

Dashboard Module: Displays Total Students, Partner Companies, Open Job Postings, Students Placed, recent job postings and notifications.

Student Management: Manages student name, department, CGPA, email, phone and placement status. Search and status filtering are provided.

Company Management: Manages company ID, company name, industry, contact email and website.

Job Posting Management: Manages job role, company, package, minimum CGPA, deadline and open/closed status.

Application Management: Tracks student applications and their status through the placement pipeline.

11. FUNCTIONAL REQUIREMENTS

- The system shall display placement statistics on the dashboard.
- The system shall allow student records to be managed.
- The system shall provide student search and status filtering.
- The system shall allow company information to be managed.
- The system shall allow job postings to be created and managed.
- The system shall provide job status filtering.
- The system shall allow applications to be submitted to available jobs.
- The system shall display application status.
- The system shall display placement-related notifications.

12. NON-FUNCTIONAL REQUIREMENTS

Usability: The interface should be simple and easy to understand.

Performance: Local JavaScript processing allows quick interaction for the prototype data set.

Maintainability: The code is organized into HTML, CSS and JavaScript sections.

Portability: The application can run on systems with a modern web browser.

Responsiveness: CSS media queries are included to improve layout on smaller screens.

13. DATABASE AND DATA MANAGEMENT

The current version does not use MySQL, MongoDB or another external database. JavaScript arrays are used as an in-memory data store.

Companies: id, name, industry, email, website.

Students: id, name, department, CGPA, email, phone, status.

Job Postings: id, title, company, package, minimum CGPA, deadline, status.

Applications: student, job, company, applied date, status.

Data Persistence: Records reset when the page is refreshed. A permanent database can be integrated in a future version.

14. SYSTEM DESIGN

Navigation Design: Sidebar contains Dashboard, Students, Companies, Job Postings and Applications.

Form Design: Modal forms are used for adding students, companies, job postings and applications.

Status Design: Status pills visually identify Placed, Pending, Applied, Shortlisted, Rejected, Open and Closed records.

Dashboard Design: Statistic cards provide a quick overview of placement activity.

15. IMPLEMENTATION

The application is implemented as a single HTML file containing the HTML structure, CSS styling and JavaScript logic.

HTML: Defines the application shell, sidebar, dashboard, tables, forms, modal windows and notification area.

CSS: Provides the visual theme, responsive grid, cards, tables, buttons, status pills, modal design, hover effects and animations.

JavaScript: Controls navigation, rendering, searching, filtering, sorting, saving records, modal operations, application submission, dashboard statistics and toast notifications.

16. USER INTERFACE DESCRIPTION

Dashboard: Shows four statistics cards, recent job postings and notifications.

Students: Displays student records with ID, name, department, CGPA and status. Search and filtering are available.

Companies: Displays company ID, company name, industry, contact email and website.

Job Postings: Displays role, company, package, minimum CGPA, deadline and status.

Applications: Displays student, role, company, application date and status, with filtering by application stage.

17. TESTING

The prototype can be validated using the following functional test cases.

Test Case	Action	Expected Result
TC01	Open application	Dashboard loads successfully
TC02	Open Students	Students page is displayed
TC03	Search student	Matching records appear
TC04	Filter student status	Selected status records appear
TC05	Add student	New student is displayed
TC06	Add company	New company is displayed
TC07	Add job posting	New job is displayed
TC08	Filter jobs	Matching job status appears
TC09	Apply to job	Application is created
TC10	Filter applications	Matching applications appear
TC11	Cancel modal	Modal closes
TC12	Save valid data	Record is saved

18. ADVANTAGES

- Simple and user-friendly interface.
- Centralized placement information.
- Easy student and company record management.
- Organized job postings.
- Application status tracking.
- Search, filtering and sorting facilities.
- Dashboard statistics.
- No separate server is required for the current prototype.

19. LIMITATIONS

No Permanent Database: Data is stored only in memory.

Data Reset: Records are lost when the webpage is reloaded.

No Authentication: The current version does not implement login or user authentication.

No Backend: There is no server-side API.

Prototype Scope: The current version is mainly suitable for academic demonstration and further development.

20. FUTURE ENHANCEMENTS

Database Integration: Add MySQL, PostgreSQL or MongoDB for permanent storage.

User Authentication: Provide separate access for placement officers, students and company representatives.

Backend Integration: Add a server-side API using a suitable backend technology.

Resume Management: Allow students to upload and manage resumes.

Email Notifications: Notify students about jobs, deadlines, shortlisting and interview schedules.

Eligibility Checking: Automatically identify students who meet job criteria.

Reports: Generate department-wise, company-wise and placement statistics.

Mobile Support: Extend the interface into a mobile-friendly or dedicated mobile application.

21. CONCLUSION

The CampusHire – Placement Management System provides a simple and centralized approach to managing college placement activities. It organizes student records, company information, job postings and applications through a single web interface.

The project demonstrates the practical use of HTML, CSS and JavaScript for building an interactive management application. The current prototype can be extended with permanent database storage, authentication, backend services and advanced reporting.
